

V7 Video Builder Guide

This guide is for someone opening the V7 Video Builder for the first time. It explains what each main area does, the usual workflow, and where to look when something is missing.

What the V7 Video Builder Does

V7 Video Builder is a scene-by-scene video creation UI inside ComfyUI. It helps you build a project from audio, SRT timing, scene notes, prompts, images, video clips, and final stitching.

The basic idea is:

- ? Create or load a project.
- ? Add global audio or per-scene audio.
- ? Add scenes manually, from SRT, or from Prompt Creator data.
- ? Write or generate image prompts.
- ? Generate or import images.
- ? Write or generate video prompts.
- ? Render scene videos.
- ? Stitch the final video.

Opening the Builder

Add the node named 'VRGDG Music Video Builder UI' in ComfyUI.

When the builder opens, it may show a welcome window where you can create a new project or open an existing project.

ComfyUI Builder Node

Welcome Window

The Main Layout

The builder has five main areas:

Area	What it is for
Top bar	Project menu, save, Prompt Creator tools, utilities, stop button, model downloads, fullscreen
Left panel	Scene list
Center preview	Selected image or video preview
Right panel	Scene settings, split into Scene, Image, Video, and Audio tabs

Bottom timeline	Timing, playback, scene blocks, inserts, notes, beat markers, and selected media tools
-----------------	--

The full builder screenshot at the start of this guide shows these areas together.

Starting or Loading a Project

Use the 'Menu' button in the top-left area of the builder.

Important project options:

Button	Use it when
New Project	You want to start a fresh V7 builder project
Load Project	You want to open an existing project folder
Load Last Project	You want to return to the most recent project
Save Project As	You want to duplicate the current project into a new folder
Quick Save	You want to save the current project state
Auto save	You want the builder to save changes while you work

Projects are saved under the ComfyUI output folder. A builder project contains the session JSON, SRT, generated images, scene videos, prompt files, reference images, and copied audio assets.

Menu Dropdown

Load Project Window

Adding Audio and SRT Timing

There are two audio styles:

Audio style	Best for
Global Audio	Music videos, songs, visualizers, lyric-timed projects
Scene Audio	Dialogue, short films, ads, or projects where each scene has its own audio clip

For a music video, start with global audio.

To add global audio:

- ? Open the 'Audio' tab on the right.
- ? Use the 'Timeline Audio' section.
- ? Drag audio into the drop zone or use 'Choose Global Audio'.

To use SRT timing:

- ? Use 'Choose SRT' / 'Load SRT' if available in the project flow.
- ? Or import timing from Prompt Creator.
- ? Check the timeline to make sure scenes line up with the audio.

Supported audio formats include WAV, MP3, FLAC, M4A, and OGG.

The 'Audio Tab' section later in this guide shows the audio controls.

Working With Scenes

Scenes are the main building blocks of the video. Each scene has timing, notes, image settings, video settings, and optional audio.

Use the left scene list to select a scene. The selected scene appears in the center preview and its settings appear on the right.

Common scene actions:

Action	Where
Add a new scene	Timeline + Segment
Add an insert/overlay	Timeline + Insert
Delete selected scene	Timeline x button
Edit scene name	Right panel Scene tab, Scene label
Edit timing	Right panel Scene tab, Start and End
Prevent timing changes from SRT import	Freeze SRT timing

Left Scene List

Using the Timeline

The timeline is at the bottom of the builder. It shows the global timing of the project, the playhead, scene blocks, notes, waveform, inserts, selected media tools, and beat markers.

Timeline controls:

Control	What it does
Bulk Segments	Create many manual scenes from pasted durations or start/end times
+ Scene Note	Show editable note boxes below scenes
Set In / Set Out	Mark a selected range using the playhead
Clear Range	Remove the selected range
+ Timeline Note	Add a timeline marker or note
+ Segment	Add a normal scene
+ Insert	Add an insert/overlay segment without changing the base timeline
Undo / Redo	Revert or restore timeline edits
Play / Stop	Preview audio/timeline playback
Select Multi	Select multiple scenes for batch settings or preview stitching
Waveform size	Choose small, medium, or large waveform
Snap beats	Snap edits to detected beats
Zoom - / +	Zoom the timeline view
Use Frame as Image	Save the current video frame as the selected scene image
Delete Image/Video	Remove selected media from the scene

Timeline Controls

Timeline With Scenes

Scene Tab

The 'Scene' tab stores the general information for the selected scene.

Main fields:

Field	Meaning
Scene label	Name of the scene
Freeze SRT timing	Keeps this scene timing from being changed by timing imports
Start / End	Scene start and end time
Prompt JSON path	Concept prompt JSON to import scene ideas
I2V motion notes JSON path	Motion notes to import for video prompting
Use VRGDG text context files	Use the default/global text context files
Global theme/style text file	Overall style, look, and mood reference
Global story idea text file	Overall story/concept reference
Global subject/scene text file	Character, subject, and scene reference

Use this tab first when a scene needs better direction before image or video generation.

Scene Tab

Image Tab

The 'Image' tab creates or manages the selected scene image. Pick the image model at the top of the tab.

Image modes:

Mode	Use it for
ZImage	Main local image generation workflow
Flux Klein	Flux/Klein image generation, including reference image ingredients
Nano B	NanoBanana image generation with reference images and API key
Ernie	Ernie Image generation
Enhance	Upscale or enhance a selected image
+ Custom	Load your own image for the scene

Each image mode usually has three subtabs:

Subtab	What it controls
Models	Model files, VAE/CLIP, Gemma models, LoRAs
Image Settings	Size, seed, batch size, image-to-image, reference images, trigger phrase
LLM Prompting	Notes, Gemma prompt generation, and the final image prompt

Basic image workflow:

- ? Select a scene.
- ? Open 'Image'.
- ? Pick an image mode, usually 'ZImage' for a first test.
- ? Add notes in 'LLM Prompting'.
- ? Click 'Gemma T2I' to create a prompt, or type your own prompt.
- ? Click the create button for that model, such as 'Create Z-Image'.
- ? Review the image in the center preview.

Video Tab

The 'Video' tab creates the selected scene video. At the top, choose between:

Mode	What it does
Image to Video	Uses the selected scene image plus a video prompt
Text to Video	Uses a text prompt directly, without requiring a scene image

The Video tab has three subtabs:

Subtab	What it controls
Models	LTX/video model files, audio VAE, Gemma models, video LoRAs
Video Settings	FPS, width, height, seed, warm up frames, cool down frames
LLM Prompting	Motion notes, Gemma I2V/T2V prompt generation, final video prompt

Basic Image-to-Video workflow:

- ? Create or load an image for the scene.
- ? Open 'Video'.
- ? Choose 'Image to Video'.
- ? In 'LLM Prompting', write motion notes.
- ? Keep 'Use image reference for I2V prompt?' checked if you want Gemma to look at the scene image.
- ? Click 'Gemma I2V'.
- ? Review or edit the 'Video prompt'.
- ? Click 'Create Scene Video'.

Basic Text-to-Video workflow:

- ? Open 'Video'.
- ? Choose 'Text to Video'.
- ? Write motion notes or a full video prompt.
- ? Optionally use a reference image for Gemma prompt writing.

? Click 'Create Scene Video'.

Audio Tab

The 'Audio' tab controls audio for the selected scene and the overall timeline.

Sections:

Section	What it is for
Scene Audio	Add or manage audio attached to the selected scene
Timeline Audio	Add or manage the global project audio

Use 'Scene Audio' for scene-specific dialogue or clips. Use 'Timeline Audio' for music-video timing.

Scene
Image
Video
Audio

Scene Audio

No custom scene audio selected. Use Scene Audio Options to drop or load audio for this scene.

Open Scene Audio Options

Timeline Audio

Global audio: Z:\TOSHARE\ComfyUI_windows_portable\ComfyUI\output\agentytest2_2026-05-31_15-38-10_copy\project_audio\project_audio.mp3

SRT: Z:\TOSHARE\ComfyUI_windows_portable\ComfyUI\output\agentytest2_2026-05-31_15-38-10_copy\builder_segments.srt

Global audio drives the whole timeline. Use this for music videos, songs, visualizers, and beat/lyric timing.

Drop global/timeline audio here

Choose Global Audio

Pick one audio style: use Scene Audio for per-scene dialogue/short films/ads, or Global Audio for music videos, songs, visualizers, and other timeline-driven projects.

Audio Tab

Reference Builder

The 'Reference Builder' button opens the 'Reference Image Builder'. This is for projects where scenes need consistent characters, locations, or visual references across many generated images.

Reference Builder can feed references into 'Flux/Klein' or 'Nano B', depending on the current image mode.

Use it when:

Goal	What to use
Keep the same character across scenes	Character References
Keep locations consistent	Location References
Connect scenes to specific location images	Scene Mapping
Include manually loaded image references too	Also include manually loaded reference images

Main areas:

Area	What it does
Use subject reference	Sends the character/subject reference into supported image generations
Use mapped location references	Sends the mapped location image for each scene
Character References	Upload or generate subject reference images
Extract Subjects	Uses project prompts/director notes to find subjects
Create Subject with ZImage	Generates a subject reference image
Location References	Add, upload, or generate location reference images
Extract Locations	Uses project prompts/director notes to find locations
Auto Map Locations with Gemma	Lets Gemma choose which location reference fits each scene
Scene Mapping	Manually choose the location reference for each scene
Save Reference Builder	Saves the reference setup into the project

Basic Reference Builder workflow:

- ? Choose 'Flux Klein' or 'Nano B' in the 'Image' tab.

- ? Click 'Reference Builder' in the top bar.
- ? Turn on 'Use subject reference' and/or 'Use mapped location references'.
- ? Add character and location references.
- ? Map locations to scenes.
- ? Click 'Save Reference Builder'.
- ? Generate images normally from the 'Image' tab.

Reference Image Builder

Use character references plus per-scene location references as automatic Flux/Klein reference images.

Builder Agent

The ‘Agent’ button opens the ‘Builder Agent’, a chat helper for planning, editing, troubleshooting, and optionally applying changes to the project.

The Agent is useful when you want help with:

Task	Example request
Learning the workflow	Walk me through what to do next.
Scene planning	Rewrite Scene 5 notes to match the previous scene.
Prompt cleanup	Make this image prompt more cinematic but keep the subject the same.
Video motion	Create stronger camera motion for Scene 8.
Story planning	Plan this whole song as a multi-character video.
Troubleshooting	Why is this scene not ready to render?

Agent controls:

Control	What it means
Context sent to Gemma	How much project context the Agent receives
Active scene only	Best for focused changes to the selected scene
Active scene + neighbors	Best for continuity around the selected scene
Project brief	Best for overall advice without sending every scene
Full scene plan	Best for Story Builder and large planning tasks
Agent mode: Manual	Suggest only; does not apply changes
Agent mode: Auto	Can update fields, switch modes, select scenes, and run supported actions
Purpose: Walkthrough	Helps a new user step through setup
Purpose: Scene work	Helps with scene notes, prompts, images, and video
Purpose: Story Builder	Helps plan a multi-scene story or character structure
Purpose: Troubleshoot	Helps diagnose missing setup or failed steps
Hint	Shows examples of what the Agent can do
Pop Out	Moves the Agent to its own browser window
Min	Minimizes the Agent without closing the chat
Clear Chat	Clears the current Agent conversation

Reference and story tools:

Tool	Use it for
Drop reference image	Give the Agent a visual reference for the active scene
Upload Ref	Upload one or more reference images
Add Audio	Add global/timeline audio while using Story Builder
Story Source	Paste or edit lyrics/script/source text for Story Builder
Upload Story Images	Add singers, characters, locations, or aesthetic images

Analyze Images

Turn story images into compact notes for text-only planning

Recommended beginner use:

- ? Open 'Agent'.
- ? Set 'Agent mode' to 'Manual: suggest only'.
- ? Set 'Purpose' to 'Walkthrough'.
- ? Ask what to do next.
- ? Switch to 'Scene work' when you want help with a selected scene.
- ? Use 'Auto: update fields' only when you are comfortable letting it make edits.

The image shows a dark-themed window titled "Builder Agent". At the top right are five buttons: "Hint", "Dock", "Pop Out", "Min", and "Close". Below the title bar are three dropdown menus: "Context sent to Gemma" (set to "Active scene only"), "Agent mode" (set to "Auto: update fields"), and "Purpose" (set to "Scene work"). To the right of these is a "Clear Chat" button. Below the dropdowns is a dashed box containing the text "Drop reference image for active scene" and an "Upload Ref" button. Further down is another dashed box with the text "Auto mode can update scene notes, image prompts, Flux/Nano B prompts, and video prompts when you ask it to." At the bottom is a text input area with the placeholder text "Ask the agent about this scene, lyrics, image prompt, video motion, continuity, or what to do next..." and a large blue "Send" button.

Builder Agent Window

Builder Agent Hints

Close

Context sent to Gemma

Active scene only: sends the selected scene details. Best when you want focused edits.

Active scene + neighbors: also sends nearby scenes. Best for continuity between scenes.

Project brief: sends a smaller overall project summary. Best for broad direction without stuffing the chat.

Full scene plan: sends lyrics and planning fields for up to 120 scenes. Best when assigning characters across a whole video.

Agent mode

Manual: suggest only. The agent can explain and draft ideas, but it should not apply field changes.

Auto: update fields. The agent can update notes/prompts, select scenes, switch modes, and run supported actions.

Purpose

Walkthrough: helps a new user step through the workflow and asks what they are making first.

Scene work: helps plan scenes, update notes, generate prompts, and keep creative continuity.

Story Builder: plans multi-character projects scene by scene, assigning characters, concepts, and motion notes.

Troubleshoot: focuses on setup problems, missing refs, wrong mode, failed prompts, or blocked runs.

Scene Timing

Try: split Scene 12 into 3.

Try: merge Scenes 2, 3, and 4 into Scene 2.

Try: sync existing scenes to the timeline notes.

Try: renumber scene labels.

The agent can change scene timing, split one scene, merge multiple scenes, and repair generic scene numbers.

Director Notes

Try: set Scene 8 director note to male and female.

Try: change all dual-vocal director notes to male and female.

Try: get the notes for Scene 14.

Director notes are the best place for subject mapping, who is singing, continuity, and story beats.

Prompt Fields

Try: update Scene 5 Flux notes to low angle, harsh stage light, male vocalist.

Try: write Nano B notes for Scene 9 using the director note.

Try: rewrite video motion notes for Scene 3.

Builder Agent Hints

Prompt Options

The 'Prompt Options' button opens tools for editing, creating, reloading, or clearing final prompt text files for the project.

Use this when the scene prompt boxes need to be refreshed from saved prompt files, or when you want to edit generated prompts in a larger text editor-style workflow.

Prompt Options has two groups:

Group	Buttons
Image	Create Concept Prompts, Edit Text to Image Prompts, Reload Text to Image Prompts, Reload Original T2I Prompts, Clear All T2I Prompts
Video	Create Motion Notes, Edit Image to Video Prompts, Reload Image to Video Prompts, Reload Original I2V Prompts, Clear All I2V Prompts

If the current image mode is 'Flux/Klein' or 'Nano B', the image prompt buttons change names to match that mode.

Use caution with the clear buttons. They remove prompt text from the project stage they describe.

Prompt Options Window

Gemma Runner

The 'Gemma Runner' button controls which runner is used for text-only Gemma steps.

Options:

Runner	What it means
builtin	Uses the built-in local GGUF runner
lm_studio	Uses LM Studio's local server for text-only Gemma calls

LM Studio is only for text-only Gemma steps. Vision/image-reference Gemma still uses the built-in GGUF runner.

LM Studio setup fields:

Field	What to enter
LM Studio base URL	Usually <code>http://127.0.0.1:1234/v1</code>
Available LM Studio models	Click Load LM Studio Models to fill this
LM Studio model name	The loaded chat model name from LM Studio
API key	Usually blank for local LM Studio
Test LM Studio	Sends a tiny test prompt to confirm it works

Gemma Runner window

Batch Buttons and Full Builds

The 'Menu' contains batch tools that can work across many scenes.

Button	What it does
Gemma T2I All	Creates image prompts for multiple scenes
Gemma Video All	Creates I2V/T2V prompts for multiple scenes
Image All	Runs image generation across scenes
Render All	Renders missing scene videos and stitches when possible
Stitch Preview	Stitches selected/existing scene videos into a preview
Build Full Video	Runs the larger pipeline from prompts/images/videos through final stitch
Remake Mode	Helps rerun or rebuild outputs
Stop	Stops the current workflow run

When prompted, choose the safest option first:

Option	Best for
Resume missing only	Continue without replacing finished work
Keep prompts, redo images/videos	Make new media but preserve prompt work
Redo prompts and images/videos	Start fresh for the selected stage

Build Full Video Options

When the finished video is stitched, the builder shows a 'Final Video Ready' popup. Use 'Open Video' to preview it.

Final Video Ready Popup

Prompt Creator Import

V7 can import data from the Prompt Creator.

Useful buttons:

Button	What it does
Prompt Creator	Opens the Prompt Creator panel
Import Data From Prompt Creator	Copies prompt creator outputs into the current builder project
Prompt Options	Opens prompt-related settings/options
Gemma Runner	Opens Gemma runner tools
Agent	Opens the builder assistant/agent
Reference Builder	Helps build reference material for image workflows

Imported data can include audio, SRT, concept prompts, lyric segments, motion notes, theme/style text, story idea text, and subject/scene text.

Prompt Creator Import Buttons

Models and Downloads

Use 'Download Models' in the top bar if you need model links and folder locations.

The model download window includes groups for:

Model group	Used by
LLM / Vision	Gemma text and vision prompt creation
ZImage	ZImage generation
Flux/Klein 9B	Higher quality Flux/Klein generation
Flux/Klein 4B	Smaller/lighter Flux/Klein generation
Ernie Image	Ernie image generation
LTX 2.3	Video generation

After placing models in the correct ComfyUI model folders, restart ComfyUI if dropdowns do not refresh.

Download Models Window

Saving Projects

Use 'Quick Save' often. Keep 'Auto save' on unless you have a reason to turn it off.

Use 'Save Project As' before major experiments. This creates a separate copy so you can test new prompts, models, or remake settings without damaging the original project.

Project folders may contain:

Folder or file	Purpose
vrgdg_builder_session.json	Main builder session
builder_segments.srt	Scene timing
SceneNotes.json	Scene notes export
project_context	Theme, story, subject, and prompt context files
zimage_approved	Approved/generated scene images
scene_image_previews	Image preview versions

scene_audio	Per-scene audio
rendered_scene_videos	Generated scene videos
prompts	Prompt and lyric segment files

Recommended Beginner Workflow

Use this if you are new and just want the first successful video.

- ? Add/open 'VRGDG Music Video Builder UI'.
- ? Click 'New Project'.
- ? Add global audio in the 'Audio' tab.
- ? Import SRT or create scenes with '+ Segment' / 'Bulk Segments'.
- ? Select the first scene.
- ? In 'Scene', name the scene and check the timing.
- ? In 'Image', choose 'ZImage'.
- ? In 'LLM Prompting', write simple scene notes.
- ? Click 'Gemma T2I', then 'Create Z-Image'.
- ? In 'Video', choose 'Image to Video'.
- ? Add motion notes, click 'Gemma I2V', then 'Create Scene Video'.
- ? Repeat for a few scenes.
- ? Use 'Stitch Preview' to check the flow.
- ? Use 'Build Full Video' or 'Render All' once the scenes are ready.
- ? Use 'Quick Save'.

Common Problems

Problem	What to check
No scene is editable	Select a scene from the left list or timeline
The Image/Video/Audio tabs are disabled	No scene is selected
Model dropdowns are empty	Install models, then restart ComfyUI
Gemma prompt buttons fail	Make sure the correct Gemma model and mmproj are selected

NanoBanana fails	Add the API key in the Nano B Models tab
Render All skips scenes	Scenes with selected videos may already be complete
Build Full Video replaced too much	Next time choose Resume missing only or a "keep prompts" option
Audio does not play	Check whether the project uses Global Audio or Scene Audio
Timing changed after import	Enable Freeze SRT timing on scenes you do not want changed
Image-to-video prompt looks wrong	Turn Use image reference for I2V prompt? on/off depending on whether the image should guide Gemma
